

Site incursions captured on camera

Intellicam[®] is a portable incident camera that captures site incursions, customer confrontations or any other activity in and around a work site, giving workers an extra layer of protection and providing stakeholders with specific, relevant data and evidence when needed.

Triggered by motion sensors and detectors, Intellicam[®] captures video footage of a breach to the site. The technology within the camera automatically clips the footage to provide a high-definition recording of the activity before, during and after the event.

Key benefits

- **Specific footage**

Intellicam[®] removes the need to filter through hours of unnecessary recordings as it captures the exact moments before, during and after an incident takes place.

- **Immediate access to footage**

Recordings are encrypted and stored on the device and within HRS's secure cloud storage and are available as soon as they are captured.

- **360-degree high-definition camera**

Four 1080p HD night vision cameras provide full coverage of the area and captures full-colour, high-definition recordings.

- **Compliant footage**

All footage is time and date stamped, and supported by signage to ensure that it can be used as evidence if required.

- **Portable**

Intellicam[®] is a lightweight system which can be set up in minutes by just one person, and can be easily moved if required.

- **Versatile**

Intellicam[®] links to HRS's Intellicone[®] Portable Site Alarms, Closure Beacons or Intellicone[®] Incursion Prevention & Warning System (IIPAWS).

Additional site security

Our aim is to ensure that road workers are always safe while they are on site. Intellicam® is part of a range of solutions that HRS has developed which protects road workers and is designed to enhance HRS's Intellicone® Incursion Prevention Warning System (IIPAWS). HRS's solutions can work independently of each other or, for enhanced work zone safety and security, can be linked and work together.

For example, Intellicam® can link to Intellicone® Portable Site Alarms, Closure Beacons or HRS's IIPAWS system which are proven to provide digital security around work zones. The sensors and alarms in these systems will trigger visible and audible alarms which alert workers if a site has been breached, giving them time to take evasive action.

If a site is breached, the sensors will activate Intellicam® and a recording will be created which will be date- and time-stamped and stored securely to be used to fact-check the activity or to be used as evidence if required.

Supported by CCTV signage, Intellicam® also acts as a deterrent to members of the public who may consider breaching the site.

Signage

To comply with the law, it is important that CCTV signage is deployed near Intellicam® and is visible and readable to everyone that could be captured by the system. This includes members of the public outside the work area.

Satisfied clients

"I was very impressed with the functionality and easy set-up of Intellicam®. The camera captured a dangerous driver and a member of public moving the temporary traffic management in an attempt to gain access to site. The cameras were a great deterrent and I believe their presence on site along with the CCTV signage prevented a lot of incursions whilst the full closure was on."

Philip Wilson, Supervisor, HS2

HRS product range

- Intellicone® Smart Taper
- Intellicone® Incursion Prevention & Warning System (IIPAWS)
- Intelliframe®
- Intelliframe® Lite
- Dynamic Speed Sign
- Works Egress System
- Customer Communication Terminal
